

IN THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Previously Presented) A method for accessing a wireless local area network in a telecommunications system, the system including at least one terminal and a plurality of networks, the method comprising:

storing information sets describing settings used to access wireless local area networks and their associated resources;

scanning for information related to names of available wireless local area networks using the terminal;

determining available information sets by comparing the information related to names of available wireless local area networks to the stored information sets; and

accessing at least one wireless local area network based on settings described in the available information sets.

2. (Previously Presented) The method of claim 1, further comprising:  
informing a user of the terminal about the available information sets;  
receiving a user's selection of one of the available information sets; and  
accessing at least one wireless local area network based on the settings described in the available information set selected by the user.

3. (Previously Presented) The method of claim 1, wherein the stored information sets are stored separately for each wireless local area network on a smart card.

4. (Previously Presented) The method of claim 1, wherein the storing stores network names of wireless local area networks associated with the stored information sets, the scanning sends network identity requests and searches for network identity responses, and the determining available information sets determines the available information sets by comparing the stored network names to the scanned information related to names of available wireless local area networks.

5. (Previously Presented) The method of claim 4, further comprising:  
storing network identifiers representing a group of network names using wildcard characters in the stored information sets; and  
determining the available information sets by comparing the stored network identifiers to the scanned information related to names of available wireless local area networks.

6. (Cancelled)

7. (Previously Presented) The method of claim 1, wherein the stored information sets comprise channel settings indicating whether at least one of (i) a used radio channel is automatically or manually selected and (ii) whether the stored information sets comprise operation mode settings indicating whether a used operation mode is an ad-hoc mode or an infrastructure mode.

8. (Previously Presented) A terminal comprising:  
a transceiver configured to communicate with a wireless local area network;  
memory means for storing information sets describing settings used to access wireless local area networks and their resources;  
scanning means for scanning for information related to identifying names of available wireless local area networks;  
determination means for determining available information sets by comparing the information related to names of available wireless local area networks to information sets stored by the memory means; and  
access means for accessing at least one wireless local area network based on the settings described in one or more of the available information sets.

9. (Previously Presented) The terminal of claim 8, further comprising:  
user interface means for informing a user of the terminal about the available information sets and letting the user select one of the available information sets; and  
wherein the access means are configured to access at least one wireless local area network based on the settings described in the one information set the user has accepted.

10. (Previously Presented) The terminal of claim 8, wherein the stored information sets are stored as network-specific profiles on a smart card that may be accessed by the terminal.

11. (Previously Presented) The terminal of claim 8, wherein the memory means are configured to store names of the wireless local area networks belonging to the stored information sets,

wherein the scanning means are arranged to perform the scanning by sending network identity requests and searching for network identity responses, and

wherein the determination means are configured to determine the available information sets by comparing the stored network names to the scanned information identifying the names of the available wireless local area networks.

12. (Cancelled)

13. (Previously Presented) The terminal of claim 8, wherein the stored information sets comprise channel settings indicating at least one of (i) whether a used radio channel is automatically or manually selected and (ii) whether the stored information sets comprise operation mode settings indicating whether a used operation mode is an ad-hoc mode or an infrastructure mode, and

wherein the terminal is configured to select at least one of (i) the used radio channel based on channel settings of the available information sets and (ii) an ad-hoc mode or an infrastructure mode based on the operation mode settings of the available information sets.

14. (Previously Presented) A terminal comprising:  
a transceiver configured to communicate with a wireless local area network;  
at least one memory device configured to store information sets describing settings used to access wireless local area networks and their resources;  
at least one scanner configured to scan information related to identifying names of available wireless local area networks;  
at least one determination module configured to determine available information sets by comparing the information related to names of available wireless local area networks to information sets stored by the memory means; and

at least one access device configured to access at least one wireless local area network based on settings described in one or more of the available information sets.

15. (Previously Presented) The terminal of claim 14, further comprising:  
at least one user interface configured to inform a user of the terminal about the available information sets and letting the user select one of the available information sets,  
wherein the at least one access device is arranged to access at least one wireless local area network based on the settings described in the one information set the user has accepted.

16. (Previously Presented) The terminal of claim 14, wherein the stored information sets are stored as network-specific profiles on a smart card that may be accessed by the terminal.

17. (Previously Presented) The terminal of claim 14, wherein the at least one memory device is arranged to store names of the wireless local area networks belonging to the stored information sets,  
wherein the at least one scanner is configured to perform the scanning by sending network identity requests and searching for network identity responses, and  
wherein the at least one determination module is configured to determine the available information sets by comparing the stored network names to the scanned information identifying the names of the available wireless local area networks.

18. (Cancelled)

19. (Previously Presented) The terminal of claim 14, wherein the stored information sets comprise channel settings indicating at least one of (i) whether a used radio channel is automatically or manually selected and (ii) whether the stored information sets comprise operation mode settings indicating whether a used operation mode is an ad-hoc mode or an infrastructure mode, and  
wherein the terminal is configured to select at least one of (i) the used radio channel based on channel settings of the available information sets and (ii) an ad-hoc mode or an infrastructure mode based on the operation mode settings of the available information sets.

20. (New) A method according to claim 1, wherein the information set comprises at least one of the following: DHCP (Dynamic Host Control Protocol) settings, TCP/IP (Transport Control Protocol/Internet Protocol) settings, Proxy settings, or domain logon and work-group settings.

21. (New) A method according to claim 8, wherein the information set comprises at least one of the following: DHCP (Dynamic Host Control Protocol) settings, TCP/IP (Transport Control Protocol/Internet Protocol) settings, Proxy settings, or domain logon and work-group settings.

22. (New) A method according to claim 14, wherein the information set comprises at least one of the following: DHCP (Dynamic Host Control Protocol) settings, TCP/IP (Transport Control Protocol/Internet Protocol) settings, Proxy settings, or domain logon and work-group settings.
